Product Description

BCS America 26" Precision Depth Roller without Tiller

BCS's exclusive Precision Depth Roller (PDR) is a versatile accessory that transforms the BCS 26" or 30" Tiller into a hybrid attachment that combines the final bed preparation and cultivating advantages of a Power Harrow with the vegetation-chopping and groundbreaking abilities of a Tiller.

Fitted to the 26" or 30" BCS Rear-Tine Tiller, the PDR consists of a full-length roller that enables the operator to precisely set the depth of penetration of the tines.

- Particularly useful as a final bed preparation tool, the tines can be set at a shallow depth of 0.5 - 2 inches to mix in soil amendments and loosen the soil for the quick growth of young roots. The roller also gently compacts the top layer for improved performance of mechanical seeders and seed germination.
- As a cultivator, the ability to maintain a shallow depth eliminates emerging weeds and creates a dirt mulch, without bringing dormant weed seeds to the surface.
- To efficiently power compost cover crops and plant residues, and to break new ground, the roller can be instantly raised to its highest setting; thereby allowing the tines to till to a deeper depth.
- Perfect for quickly and evenly burying cover crop seeds.

FEATURES

- Full-width roller maintains precise tine depth in 0.5" increments.
 - Roller gently compacts the soil surface to create a ready-to-plant seedbed.
 - Preserves soil structure and prevents hard pan.
 - Deepest setting with roller will achieve max tine depth of 7" (no reason to remove PDR).
 - Shallowest setting raises tines off the ground with roller acting as transport wheel.
 - 38 pounds without the tiller (30" version).
 - 3/16" steel with lightening holes to reduce weight.
-
